

# KHAAD BHARAT: Farmer Application Guide

*Step-by-Step Biochar Use Guide for Farmers & Nursery Managers*

---

## 1. The Importance of Charging (Inoculation)

**WARNING:** Never apply raw biochar directly to seeds or crop roots. Raw biochar is a highly empty sponge. If applied raw, it will absorb nutrients from the soil first, which can temporarily stunt seedling growth. Always charge (inoculate) the biochar before putting it in your soil.

## 2. How to Inoculate Biochar (Step-by-Step)

- \* **Mixing Ratio:** Mix 1 part KHAAD BHARAT Biochar with 4 parts animal manure, mature compost, or cow dung slurry.
- \* **Moisture Maintenance:** Add water or liquid organic inputs (such as Jeevamrutha or compost tea) until the mix is damp like a wrung-out sponge.
- \* **Incubation:** Cover the heap with gunny bags and let it incubate for 10 to 14 days. Stir once or twice. This pre-loads the carbon pores with microbes and nutrients.

## 3. Application Rates by Crop

- \* **Field Crops (Wheat/Paddy):** Apply 1 to 1.5 tons of charged biochar mixture per acre during field preparation or final tilling.
- \* **Vegetables & Horticulture:** Incorporate 10% to 15% charged biochar by volume directly into the root zone beds.
- \* **Nursery Beds:** Blend 10% biochar with coco peat and vermicompost for maximum seed germination and root health.
- \* **Fruit Trees (Orchards):** Apply 2 to 3 kg of charged biochar around the drip line of each tree and cover with mulch.
